## Electronics <br> The Amplifier Chain

## Electronics

## The Main Amplifier

## Electronics <br> The Main Amplifier Input Stage

That is, what it does

That is, what it means

How does it work ?

## Electronics

## NMR Control of a Bending Magnet to 3•10-6

Difficult to interpret
Is there a more compact way to display the dynamics of a system ?

## Electronics

## Understanding Transfer Functions

- The water tank is filled from a reservoir of unlimited capacity;
- The water level approaches exponetially $\mathrm{h}_{0}$.

The temperature of a piece of metal approaches exponetially $100^{\circ} \mathrm{C}$.

The voltage at the capacitor approaches exponetially $U_{0}$

## Electronics

## Understanding Transfer Functions

How can the dynamics of a linear system be described most efficiently ?

Refinery
Aeroplane
Musical instrument
Electrical Circuit
Nucleus

## Electronics

## Understanding Transfer Functions

- Is a "generalized" Fourier Transform $f(t) \rightarrow F(s)$ with $s=\rho+i \omega$
- Is an integral transform, and therefore linear
- „Algebraizes" linear differential equations
- A convolution in the time domain corresponds to a multiplication of the corresponding Laplace transforms

Scheme:

## Electronics

## Understanding Transfer Functions

| F(s) | $\mathbf{f}(\mathbf{t})$ | Remark |
| :---: | :---: | :---: |
| a $\mathrm{F}_{1}(\mathrm{~s})+\mathrm{b} \mathrm{F}_{2}(\mathrm{~s})$ | $a f_{1}(t)+b f_{2}(t)$ | Linearity |
| $s \mathrm{~F}(\mathrm{~s})-\mathrm{f}(0)$ | $\mathrm{f}^{\prime}(\mathrm{t})$ | Derivative |
| $\begin{gathered} s^{n} \mathrm{~F}(\mathrm{~s})-\mathrm{s}^{(\mathrm{n}-1)} \mathrm{f}(0)- \\ -\mathrm{s}^{(\mathrm{n}-2)} \mathrm{f}^{6}(0) \ldots .-\mathrm{f}^{(\mathrm{n}-1)}(0) \end{gathered}$ | $\mathrm{f}^{(\mathrm{n})}(\mathrm{t})$ | $\mathrm{n}^{\text {th }}$ derivative |
| $\frac{F(s)}{s}$ | $\int_{0}^{t} f(u) d u$ | Integral |
| $\frac{F(s)}{s^{n}}$ | $\int_{0}^{t} \ldots \int_{0}^{t} f(u) d u^{n}=\int_{0}^{t} \frac{(t-u)^{n-1}}{(n-1)!} f(u) d u$ | n -fold integral |
| $F(s) \cdot G(s)$ | $\int_{0}^{t} f(u) g(t-u) d u$ | Convolution in the time domain |

## Electronics

## Understanding Transfer Functions

| F(s) | $\mathbf{f}(\mathbf{t})$ |
| :---: | :---: |
| $\frac{1}{s}$ | 1 |
| $\frac{1}{s^{2}}$ | t |
| $\frac{1}{s^{n}} \quad n=1,2,3, \ldots$ | $\frac{t^{n-1}}{(n-1)!}, \quad 0!=1$ |
| $\frac{1}{s-a}$ | $\mathrm{e}^{\text {at }}$ |
| $\frac{1}{s^{2}+a^{2}}$ | $\frac{\sin a t}{a}$ |
| $\frac{s}{s^{2}+a^{2}}$ | $\cos (\mathrm{at})$ |
| $\frac{1}{s^{2}-a^{2}}$ | $\frac{\sinh a t}{a}$ |
| $\frac{\mathrm{P}(\mathrm{s})}{\mathrm{Q}(\mathrm{s})} ; \mathrm{Q}(\mathrm{s})=\left(\mathrm{s}-\alpha_{1}\right) \ldots\left(\mathrm{s}-\alpha_{\mathrm{n}}\right)$ | $\sum_{\mathrm{k}=l}^{\mathrm{n}} \frac{\mathrm{P}\left(\alpha_{\mathrm{k}}\right)}{\mathrm{Q}^{\prime}\left(\alpha_{\mathrm{k}}\right)} \mathrm{e}^{\alpha_{\mathrm{k}} \mathrm{t}} ; \mathrm{Q}^{\prime}\left(\alpha_{\mathrm{k}}\right)=\frac{\mathrm{dQ}\left(\alpha_{\mathrm{k}}\right)}{\mathrm{d}\left(\mathrm{~s}-\alpha_{\mathrm{k}}\right)}$ |

## Electronics

## Understanding Transfer Functions

$$
\begin{aligned}
& \mathrm{Q}=\mathrm{C} \mathrm{U} ; \dot{\mathrm{Q}=\mathrm{I}=\mathrm{CU}} \quad \mathrm{I}(\mathrm{~s})=\mathrm{sCU}(\mathrm{~s}) \xrightarrow[R_{C}=\frac{\mathrm{U}(\mathrm{~s})}{\mathrm{I}(\mathrm{~s})}=\frac{1}{\mathrm{sC}}]{ } \quad \text { Recall: } \mathrm{s}=\mathrm{Q}+\mathrm{i} \omega
\end{aligned}
$$

Feedback (especially: negative feedback)

$$
\left.\begin{array}{l}
Y(s)=F_{1}(\mathrm{~s}) \cdot \Delta(\mathrm{s}) \\
\Delta(\mathrm{s})=X(\mathrm{~s})^{\mp} \mathrm{R}(\mathrm{~s}) \\
\mathrm{R}(\mathrm{~s})=\mathrm{F}_{2}(\mathrm{~s}) \cdot \mathrm{Y}(\mathrm{~s})
\end{array}\right\} \rightarrow Y(\mathrm{~s})=\mathrm{F}_{1}(\mathrm{~s}) \cdot\left\{X(\mathrm{~s}) \mp\left(\mathrm{F}_{2}(\mathrm{~s}) \cdot \mathrm{Y}(\mathrm{~s})\right)\right\}
$$

$$
T(s)=\frac{Y(s)}{X(s)}=\frac{F_{1}(s)}{1 \pm F_{1}(s) \cdot F_{2}(s)}
$$

Trick: $F_{1}(s) \rightarrow \infty \Rightarrow T(s)= \pm \frac{1}{F_{2}(s)}= \pm F_{2}^{-1}(s)$

## Electronics

## Understanding Transfer Functions

$T(s)=F_{0}(s) \cdot \frac{F_{1}(s)}{1-F_{1}(s) \cdot F_{2}(s)} \xrightarrow{F_{1}(s) \rightarrow \infty} \frac{F_{0}(s)}{-F_{2}(s)}=-\frac{Z_{2}}{Z_{1}}$
with: $\mathrm{F}_{0}(\mathrm{~s})=\mathrm{I}_{\text {in }} / \mathrm{U}_{\text {in }}=1 / \mathrm{Z}_{1}$
$F_{1}(s)=-R \cdot V \quad ; R$ can be considered to convert the
$F_{2}(s)=I_{R} / U_{\text {out }}=1 / Z_{2} \quad$ Input Current $\Delta I$ to the internal Input Voltage $U_{\text {int }}^{-}$.

## Electronics

## Understanding Transfer Functions

Integrator $\left(U_{\text {off }}=0\right)$

## Differentiator

The „s" in the denominator and nominator determine the dynamics of a system

## Electronics

## Understanding Transfer Functions

$$
\mathrm{T}(\mathrm{~s})=\frac{\mathrm{U}_{\mathrm{out}}(\mathrm{~s})}{\mathrm{U}_{\mathrm{in}}(\mathrm{~s})}=\frac{\mathrm{R}_{1}}{\frac{1}{\mathrm{sC}}+\mathrm{R}_{1}}
$$

$$
\mathrm{U}_{\text {out }}(\mathrm{s})=\mathrm{T}(\mathrm{~s}) \cdot \mathrm{U}_{\text {in }}(\mathrm{s})=\mathrm{U}_{0} \frac{\mathrm{~s}}{\left(\mathrm{~s}+1 / \mathrm{CR}_{1}\right)\left(\mathrm{s}+1 / \mathrm{T}_{0}\right)}
$$

$$
\mathrm{U}_{\text {out }}(\mathrm{t})=\mathrm{U}_{0} \frac{1}{\left(\mathrm{CR}_{1}-\mathrm{T}_{0}\right)}\left(\mathrm{CR}_{1} \mathrm{e}^{-\frac{\mathrm{t}}{\mathrm{~T}_{0}}}-\mathrm{T}_{0} \mathrm{e}^{-\frac{\mathrm{t}}{\mathrm{CR}_{1}}}\right)
$$

Undershoot

Electronics

## The Principle of Pole-Zero Cancellation

$$
\mathrm{R}_{\mathrm{P}}=\mathrm{R}_{1} \| \mathrm{R}_{2}=\frac{\mathrm{R}_{1} \cdot \mathrm{R}_{2}}{\mathrm{R}_{1}+\mathrm{R}_{2}}
$$

$$
\mathrm{T}(\mathrm{~s})=\frac{\mathrm{s}+\frac{\mathrm{k}}{\mathrm{R}_{2} \mathrm{C}}}{\mathrm{~s}+\frac{1}{\mathrm{R}_{\mathrm{P}} \mathrm{C}}}
$$

That is, how it works

## Electronics

## Understanding Transfer Functions

Stable Systems have Poles only in the negative half plane (imaginary axis included), since otherwise $\rho>0$

Allpasses stand out due to the symmetric position of Poles and Zeros with respect to the imaginary axis. $|\mathrm{T}(\mathrm{s})|=$ const.; but the phase changes.

Phase minimum systems do not have any Zeros in the right half-plane.

## Inferences:

All stable linear systems can be set up by allpasses and phase minimum systems.

## Electronics

## PZ-Scheme of an $3^{\text {rd }}$ Order Allpass

## Electronics

## Pulse Shaping

## Electronics

## The Idea Behind an Optimum S/N-Ratio

## Electronics

 Pulse Shaping

## Electronics Pulse Shaping

## Electronics <br> Pulse Shaping

Semi-Gaussian pulse shaping has the fewest harmonics and allows to amplify these pulses with the comparatively smallest bandwidth. Therefore, all noise outside this bandwidth can be suppressed.

## Electronics Summary

## Transfer Functions:

Have a wide field of applications- Are an universal tool to handle even aperiodic signals
- Give a very basic understanding of systems
- Allow to evaluate or predict the dynamical behavior of a system

## Electronics

User: student PW: SSXX WSXX

## Electronics Questions

- Give two reasons why the P/Z circuit is termed "principal".

- Convince yourself „graphically" that the amplitude of an Allpass does not depend on frequency.

—Does the „trick" of linearizing (in negative feedback systems) apply only to operational amplifiers?

Electronics

## The Preamplifier

## $\mathrm{Q}=\mathrm{C} \mathrm{U}$

## Q/U Converter

The output voltage is changed, until the charge via $C$ compensates $\mathbf{Q}_{\mathrm{in}}$ from the input

## Electronics <br> Appendix A1 (Backtransform)

$$
\mathrm{U}_{\text {out }}(\mathrm{s})=\mathrm{T}(\mathrm{~s}) \cdot \mathrm{U}_{\text {in }}(\mathrm{s})=\mathrm{U}_{0} \frac{\mathrm{~s}}{\left(\mathrm{~s}+1 / \mathrm{CR}_{1}\right)\left(\mathrm{s}+1 / \mathrm{T}_{0}\right)}
$$

$$
\mathrm{U}_{\mathrm{out}}(\mathrm{t})=\mathrm{U} 0 \cdot\left\{\frac{-1 / \mathrm{CR}_{1}}{-1 / \mathrm{CR}_{1}+1 / \mathrm{T}_{0}} e^{-1 / \mathrm{CR}_{1}}+\frac{-1 / \mathrm{T}_{0}}{-1 / \mathrm{T}_{0}+1 / \mathrm{CR}_{1}} e^{-1 / \mathrm{T}_{0}}\right\}
$$

$$
\mathrm{U}_{\text {out }}(\mathrm{t})=\mathrm{U} 0 \cdot\left\{\frac{-\mathrm{T}_{0}}{-\mathrm{T}_{0}+\mathrm{CR}_{1}} e^{-1 / \mathrm{CR}_{1}}+\frac{-\mathrm{CR}_{1}}{-\mathrm{CR}_{1}+\mathrm{T}_{0}} e^{-1 / \mathrm{T}_{0}}\right\}
$$

$$
\mathrm{U}_{\mathrm{out}}(\mathrm{t})=\mathrm{U} 0 \cdot \frac{1}{\mathrm{CR}_{1}-\mathrm{T}_{0}}\left\{\mathrm{CR}_{1} e^{-1 / \mathrm{T0}}+\mathrm{T}_{0} e^{-1 / \mathrm{CR} 1}\right\} \quad \text { q.e.d. }
$$

## Electronics

## Appendix A2 (P/Z Calculation)

Start with: $\mathrm{I}_{1}=\mathrm{I}_{\mathrm{C}}+\mathrm{I}_{2}$

Recall: $\mathrm{U}_{\text {out }}=\mathrm{R}_{1} \cdot \mathrm{I}_{1}=\mathrm{R}_{1}\left(\mathrm{I}_{\mathrm{C}}+\mathrm{I}_{2}\right)$
$\mathrm{U}_{\text {out }}(\mathrm{s})=\mathrm{R}_{1}\left\{\frac{1}{\mathrm{R}_{2}}\left[\mathrm{k} \cdot \mathrm{U}_{\text {in }}(\mathrm{s})-\mathrm{U}_{\text {out }}(\mathrm{s})\right]+\mathrm{C}\left[\mathrm{sU}_{\text {in }}(\mathrm{s})-\mathrm{sU}_{\text {out }}(\mathrm{s})\right]\right\}$
$\mathrm{U}_{\text {out }}(\mathrm{s})\left[1+\frac{\mathrm{R}_{1}}{\mathrm{R}_{2}}+\mathrm{sCR} R_{1}\right]=\mathrm{U}_{\text {in }}(\mathrm{s})\left[\mathrm{k} \frac{\mathrm{R}_{1}}{\mathrm{R}_{2}}+\mathrm{sCR} R_{1}\right]$
$\mathrm{T}(\mathrm{s})=\frac{\mathrm{U}_{\mathrm{out}}(\mathrm{s})}{\mathrm{U}_{\mathrm{in}}(\mathrm{s})}=\frac{\mathrm{k} \frac{\mathrm{R}_{1}}{\mathrm{R}_{5}}+\mathrm{sCR}_{1}}{1+\frac{\mathrm{R}_{1}}{\mathrm{R}_{7}}+\mathrm{sCR} R_{1}}=\frac{\frac{\mathrm{k}}{\mathrm{R}_{2} \mathrm{C}}+\mathrm{s}}{\left(\frac{1}{\mathrm{R}}+\frac{1}{\mathrm{R}}\right) \frac{1}{\mathrm{C}}+\mathrm{s}}=\frac{\mathrm{s}+\frac{\mathrm{k}}{\mathrm{R}_{2} \mathrm{C}}}{\mathrm{s}+\frac{1}{\mathrm{R}_{\mathrm{n}} \mathrm{C}}} \quad$ q.e.d.

# Electronics <br> <br> Appendix A3 (P/Z Circuit Considerations - Reality) 

 <br> <br> Appendix A3 (P/Z Circuit Considerations - Reality)}
$T(s)=\frac{s+\frac{k}{R_{2} C}}{s+\frac{1}{R_{P} C}}$
In order to have: $\frac{\mathrm{k}}{\mathrm{R}_{2}}=\frac{1}{\mathrm{R}_{\mathrm{p}}}$
recall that $\mathbf{R}_{\mathrm{p}} \leq \mathbf{R}_{2}$
Therefore: $\frac{\mathrm{k}}{\mathrm{R}_{2}} \geq \frac{1}{\mathrm{R}_{2}}$ or: $\mathrm{k} \geq 1$
But since $k$ is always a fraction of 1 this constitutes a contradiction.

## Solution:

## But what is with $C_{2}$ ?

One can always find for any given $\omega$ a C , so that $R_{C}=\frac{1}{s C} \xrightarrow{\rho=0} \frac{1}{i \omega C} \ll R_{2}$

Electronics

## Appendix B (Scheme of an $1^{\text {st }}$ Order Allpass)

$$
\begin{aligned}
& \mathrm{U}_{\text {out }}=\mathrm{U}_{\mathrm{R}_{1}}-\mathrm{U}_{\mathrm{C}}=\frac{1}{2} \mathrm{U}_{\text {in }}-\frac{\mathrm{R}_{\mathrm{C}}}{\mathrm{R}+\mathrm{R}_{\mathrm{C}}} \mathrm{U}_{\text {in }} \\
& \mathrm{T}_{\mathrm{C}}(\mathrm{~s})=\frac{\mathrm{U}_{\text {out }}}{\mathrm{U}_{\text {in }}}=\frac{1}{2} \frac{\mathrm{R}+\mathrm{R}_{\mathrm{C}}-2 \mathrm{R}_{\mathrm{C}}}{\mathrm{R}+\mathrm{R}_{\mathrm{C}}}=\frac{1}{2} \cdot \frac{\mathrm{R}-1 / \mathrm{sC}}{\mathrm{R}+1 / \mathrm{sC}}=\frac{1}{2} \cdot \frac{\mathrm{sRC}-1}{\mathrm{sRC}+1}
\end{aligned}
$$

## Electronics <br> Appendix C (Sallen-Key Amplifier)

$$
\begin{aligned}
& \mathrm{U}_{\Sigma} \cdot \frac{\mathrm{sC}}{\mathrm{sRC}+1}=\mathrm{I}_{\Sigma}=\frac{\mathrm{U}_{\text {in }}-\mathrm{U}_{\Sigma}}{\mathrm{R}}+\left(\mathrm{U}_{\text {out }}-\mathrm{U}_{\Sigma}\right) \cdot \mathrm{sC} \\
& =\frac{\mathrm{U}_{\text {in }}-\mathrm{U}^{+}(1+\mathrm{sRC})}{\mathrm{R}}+\left(\mathrm{U}_{\text {out }}-\mathrm{U}^{+}(1+\mathrm{sRC})\right) \cdot \mathrm{sC} \\
& \mathrm{U}^{+}\left[(1+\mathrm{sRC}) \cdot \frac{\mathrm{sC}}{\mathrm{sRC}+1}+\frac{1+\mathrm{sRC}}{\mathrm{R}}+(1+\mathrm{sRC}) \cdot \mathrm{sC}\right]=\frac{\mathrm{U}_{\text {in }}}{\mathrm{R}}+\mathrm{U}_{\text {out }} \cdot \mathrm{sC} \\
& \mathrm{U}_{\text {out }}=\mathrm{V} \cdot \frac{\mathrm{U}_{\text {in }} / \mathrm{R}+\mathrm{U}_{\text {out }} \cdot \mathrm{sC}}{\mathrm{sC}+\frac{1+\mathrm{sRC}}{\mathrm{R}}+(1+\mathrm{sRC}) \cdot \mathrm{sC}} \stackrel{\text { def }}{ } \frac{\mathrm{U}_{\text {in }} / \mathrm{R}+\mathrm{U}_{\text {out }} \cdot \mathrm{sC}}{\text { Nenner }} \\
& \mathrm{U}_{\text {out }}\left(1-\frac{\mathrm{VsC}}{\text { Nenner }}\right)=\frac{\mathrm{V}}{\mathrm{R}} \cdot \frac{\mathrm{U}_{\text {in }}}{\text { Nenner }} \\
& \mathrm{T}(\mathrm{~s})=\frac{\mathrm{V}}{\mathrm{R}} \cdot \frac{1}{\text { Nenner }} \cdot\left(\frac{\text { Nenner }-\mathrm{VsC}}{\text { Nenner }}\right)
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{T}(\mathrm{~s}) & =\frac{\mathrm{V}}{\mathrm{R}} \cdot \frac{1}{\mathrm{Nenner}-\mathrm{VsC}}=\frac{\mathrm{V}}{\mathrm{sRC}+1+\mathrm{sRC}+(1+\mathrm{sRC}) \cdot \mathrm{sRC}-\mathrm{VsRC}} \\
& =\frac{\mathrm{V}}{1+3 \mathrm{sRC}-\mathrm{VsRC}+(\mathrm{sRC})^{2}}=\frac{\mathrm{V}}{1+\mathrm{sRC} \cdot(3-\mathrm{V})+(\mathrm{sRC})^{2}}
\end{aligned}
$$

## Electronics Appendix D (Nonlinear Systems)

## Given:

Set of $m$ non-linear differential equations:
$\overrightarrow{\mathrm{y}}=\mathrm{f}(\overrightarrow{\mathrm{x}}, \overrightarrow{\mathrm{u}}) \quad$ with: $\overrightarrow{\mathrm{x}}-\mathrm{n} V$ ariables
$\overrightarrow{\mathrm{u}}-\ell$ Parameters
Expand for the (operating) point A:

$$
\begin{aligned}
\overrightarrow{\mathrm{y}} & \approx \mathrm{f}\left(\overrightarrow{\mathrm{x}}_{\mathrm{A}}, \overrightarrow{\mathrm{u}}_{\mathrm{A}}\right)+\underset{\substack{\mathrm{mxn} \operatorname{matrix} \mathrm{~F}}}{\frac{\partial \mathrm{f}}{\partial \overrightarrow{\mathrm{x}}_{\mathrm{A}}} \cdot \delta \overrightarrow{\mathrm{x}}}+\underset{\substack{\partial \times \ell \operatorname{matrix~}^{\mathrm{G}}}}{\mathrm{~m}_{\mathrm{A}}} \cdot \delta \mathrm{f}+\text { Higher order terms; } \mathrm{m} \leq \mathrm{n} \\
& =\mathbf{f}\left(\overrightarrow{\mathbf{x}}_{\mathrm{A}}, \overrightarrow{\mathrm{u}}_{\mathrm{A}}\right)+\mathbf{F} \cdot \delta \overrightarrow{\mathbf{x}}+\mathbf{G} \cdot \delta \overrightarrow{\mathbf{u}}
\end{aligned}
$$

This is a system of coupled linear differential equations, which can be algebraized by means of the Laplace transform.

## Electronics

## Example Ia (Principle of a Log-Antilog Multiplier)

Log-Amp

## Electronics

## Example Ib (Principle of a Log-Antilog Multiplier)

Log Amp as a negative feedback element results in a Anti-Log-Amplifier:

$$
\begin{aligned}
\mathrm{T}(\mathrm{~s}) & =\frac{\mathrm{F}(\mathrm{~s})}{1+\mathrm{F}(\mathrm{~s}) \mathrm{G}(\mathrm{~s})} \\
& =\frac{1}{1 / \mathrm{F}(\mathrm{~s})+\mathrm{G}(\mathrm{~s})} \xrightarrow{\mathrm{F}(\mathrm{~s}) \rightarrow \infty} \mathbb{1} / \mathrm{G}(\mathrm{~s})=\mathrm{G}^{-1}(\mathrm{~s})
\end{aligned}
$$

Example of an analog multiplier: Amplitude modulation
Carrier frequency: $\mathbf{v}_{\mathbf{x}}$ JNWNNNWNNON
Modulated signal: $\quad \mathbf{V}_{\mathrm{y}}$

Output (Modulated carrier):
$\mathbf{V}_{\mathrm{x}} \mathbf{V}_{\mathrm{y}}$
ADHADMANADADAS

## Electronics

## Example IIa (Principle of a Sonar)

## Electronics <br> Example IIb (Chirped Pulse Amplification (CPA))

Principle of the CPA: High peak intensities within the amplifier optics are avoided by timewise and spatial dilatation of the pulses.

## Electronics

## Example III (Linearizing Systems)

$\rightarrow$ the dynamics of $\mathrm{T}(\mathrm{s})$ can be determined by the position of the Pole/Zero-distribution of $\mathrm{R}(\mathrm{s})$.
