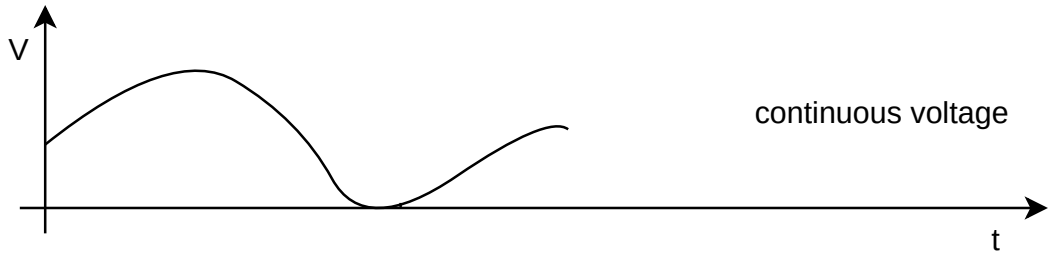
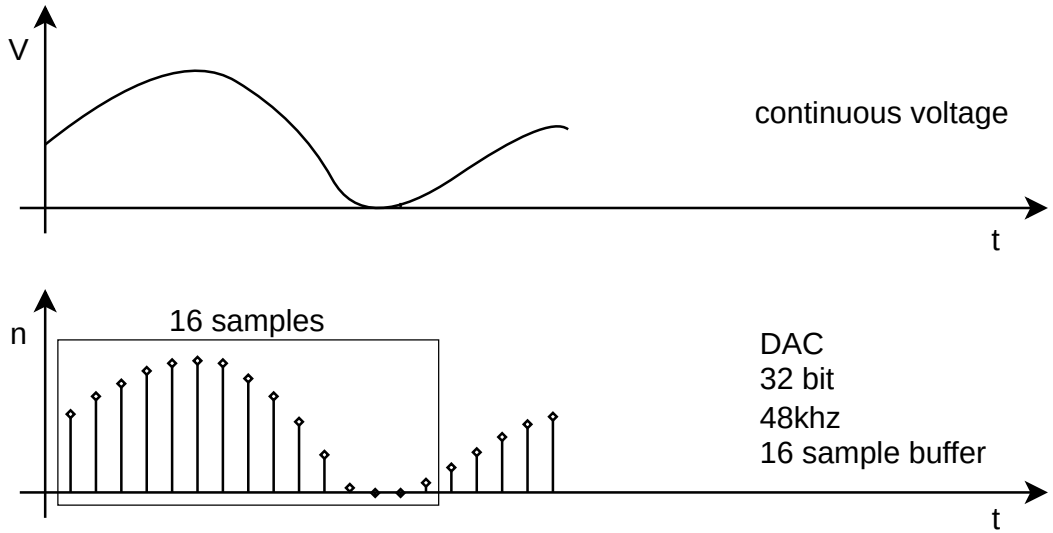
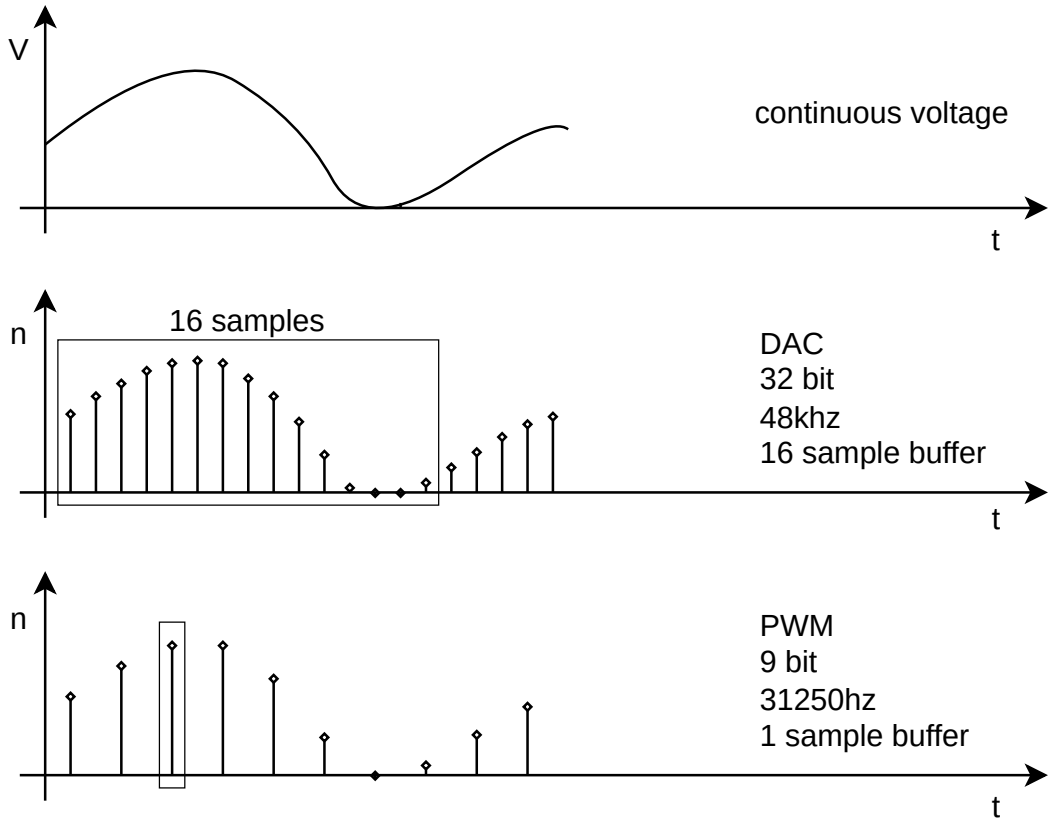
digital audio



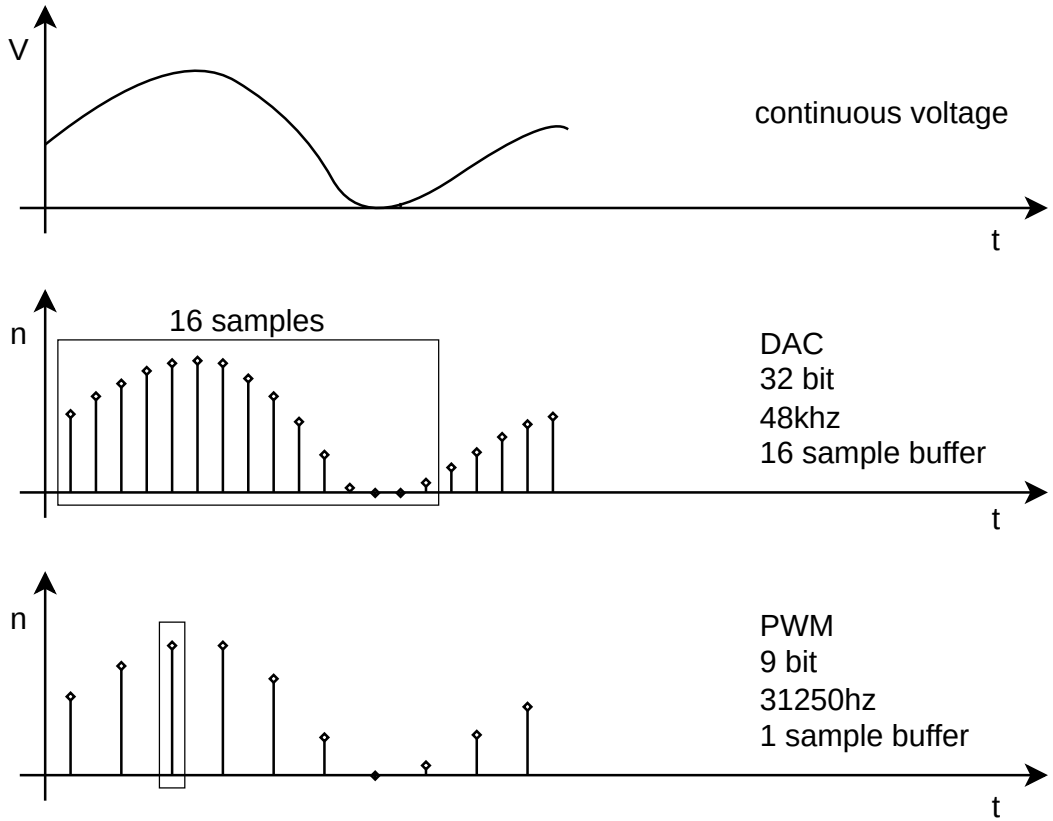
digital audio



digital audio



digital audio



$$\frac{16000000}{31250} = 512 \text{ (cycles)}$$

generating waveforms

sine wave (naive implementation):

```
float time=0;
float delta=0.1;

float generate_output(){
    time=time+delta;
    return sin(time)*512;
}
```

generating waveforms

sine wave (naive implementation):

```
float time=0;
float delta=0.1;

float generate_output(){
    time=time+delta;
    return sin(time)*512;
}
```

- -Os build
- just for one `sin` call
- huge amounts of asm = *SLOW*

generated asm:

```

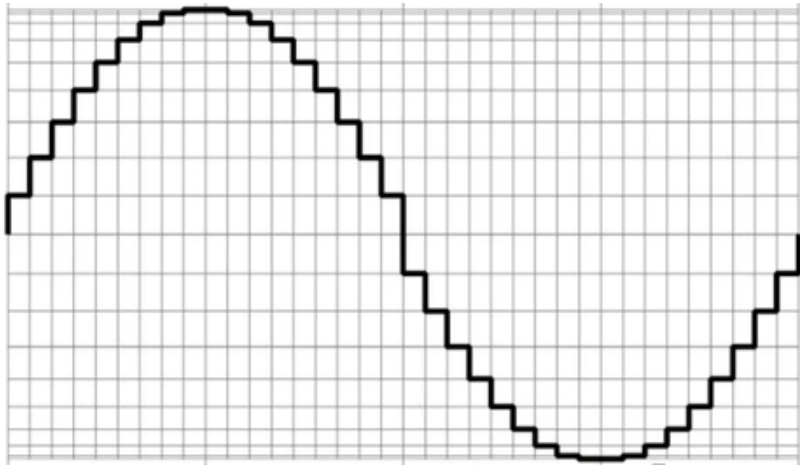
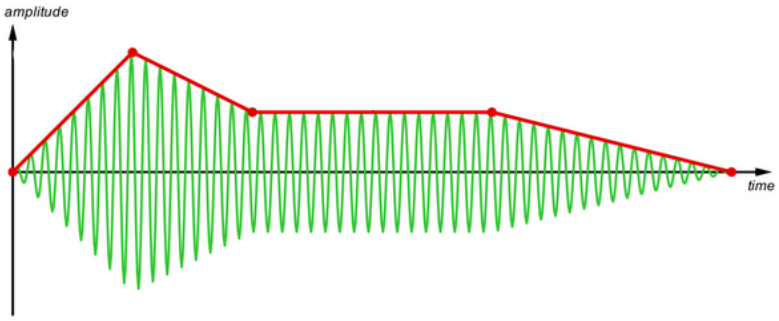
generating waveforms - using lookup tables

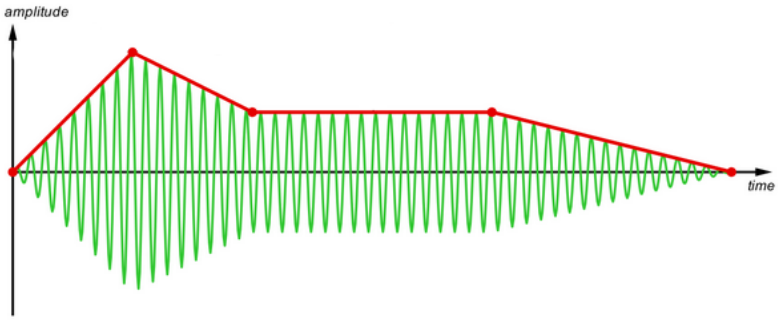
```
sine_wave[253]=
{
127, 130, 133, 137, 140, 143, 146, 149, 152, 155, 158, 162, 165, 168,
171, 174, 177, 179, 182, 185, 188, 191, 193, 196, 199, 201, 204, 206,
209, 211, 214, 216, 218, 220, 223, 225, 227, 229, 231, 232, 234, 236,
237, 239, 240, 242, 243, 244, 246, 247, 248, 249, 250, 251, 251, 252,
253, 253, 254, 254, 254, 254, 254, 255, 254, 254, 254, 254, 254, 253,
253, 252, 251, 251, 250, 249, 248, 247, 246, 244, 243, 242, 240, 239,
...}
```



scaling by using fixed point arithmetic:

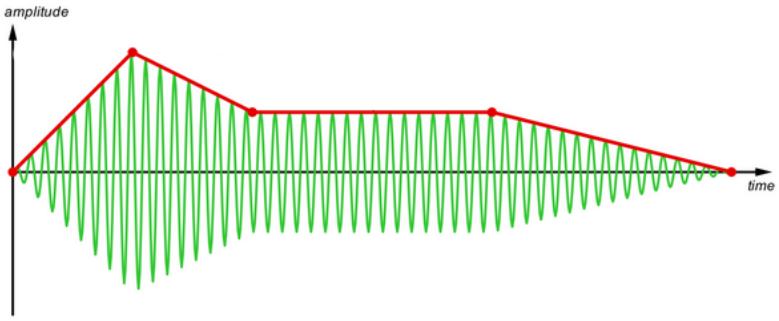


scaling by using fixed point arithmetic:



$$232 \cdot 0.32 = 74.24$$

scaling by using fixed point arithmetic:



$$232 \cdot 0.32 = 74.24$$

instead of using real numbers, we can pre-scale both operands by same factor and operate using integers:

$$(232 \cdot 2^8) \cdot 81$$

and later we just divide it by our scaling factor squared:

$$\frac{(232 \cdot 2^8) \cdot 81}{2^{16}} = 73$$

sequencer - definition

musical notation:

sequencer - definition

sequencer representation:

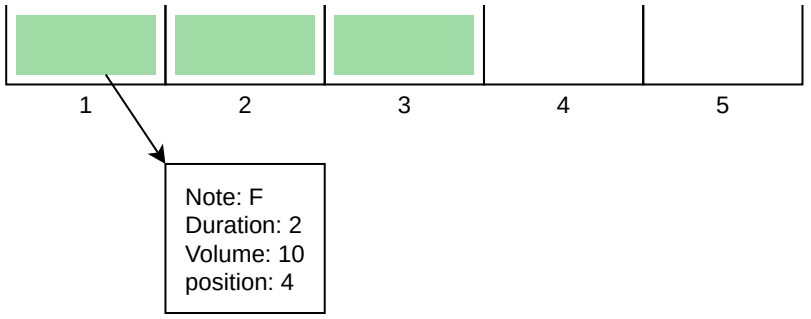
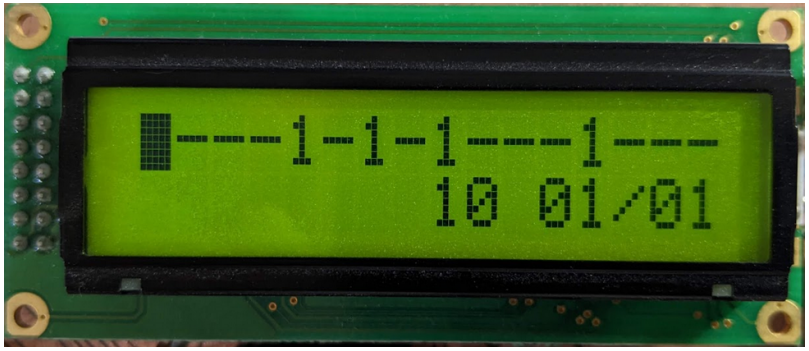
layout in memory:



sequencer - memory layout problem

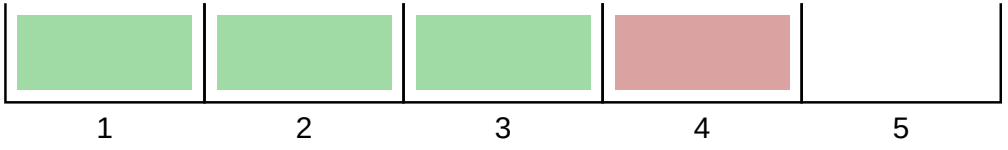
inserting a new note after the first one:



sequencer - memory layout problem

inserting a new note after the first one:

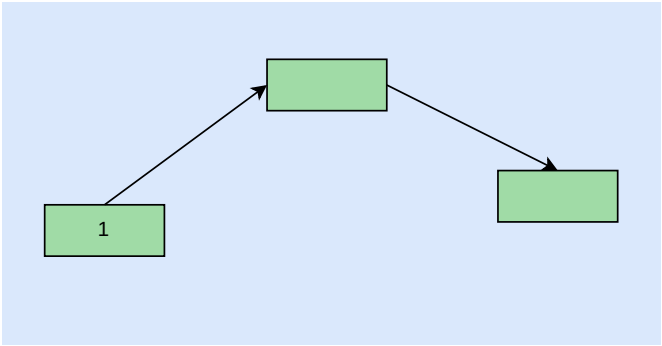
now elements in our array are out of order:



we can try to reorder old elements but depending on the number of notes this can take a lot of processor operations (cycles).

sequencer - optimal data-structure

linked list:



sequencer - optimal data-structure

sequencer - optimal data-structure

linked list:

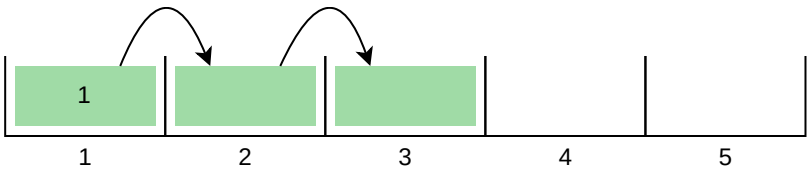
not available* on microprocessor which we're using. But we can emulate its features within an array:



sequencer - optimal data-structure

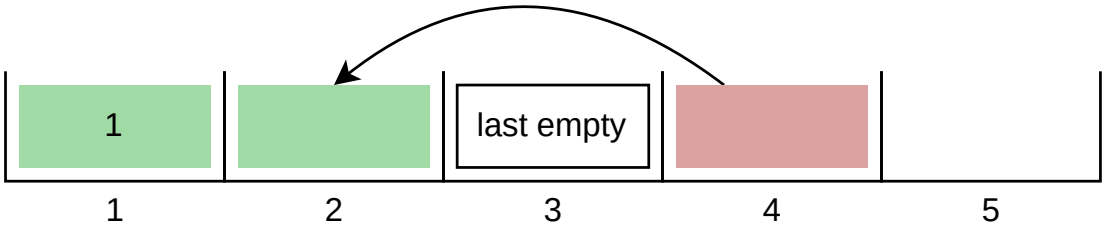
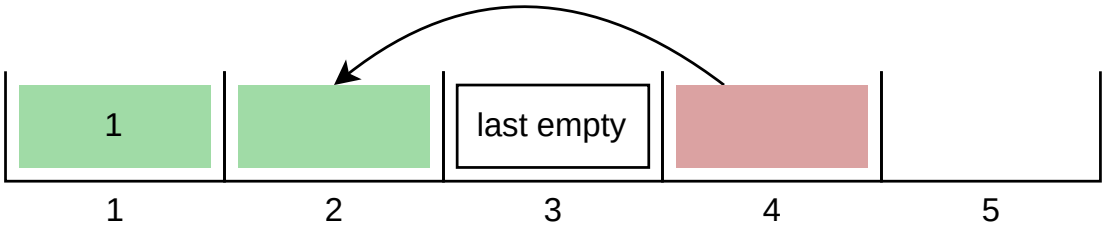
when an element is removed, its place will be reused for next new element.

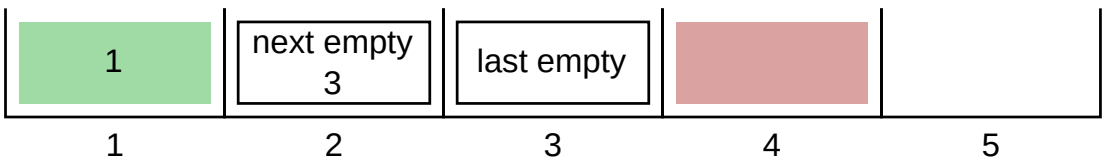


sequencer - optimal data-structure

when an element is removed, its place will be reused for next new element.



if multiple elements are removed, we add new elements in reverse order to their deletion.



this information is stored in the same array. In this way, we avoid fragmentation as well as overhead associated with other data-structures.

Conclusions:

With limited processing power I was able to achieve:

- multiple waveforms (sine, square, saw, triangle)
- 4 note polyphony
- MIDI support (12 octaves*, velocity, cc messages)
- sequencer
  - song timeline
  - chords
  - automations
- unnoticeable delay for external MIDI
- responsive graphics

Thank you for your time
